It probably existed from remote antiquity among tropical peoples, and, although attempts have been made to trace it back to a very early period, these efforts fail for lack of the careful clinical methods of diagnosis that are necessary for the recognition of such diseases. For almost fifty years after the disease was made known in Italy, and after it had been the subject of many important investigations in diagnosis, biology, and treatment, it remained for us in America chiefly an interesting, but remote, fact, devoid of practical relations. Its absence was accepted as evidence of the greater personal cleanliness and superior mode of life of our citizens, and at most it was feared that among recent immigrants cases might be imported and even spread in less favorable localities. No more striking example of the transitory state of medical knowledge can be advanced than the proof brought within the last few years, not only that hookworms exist as human parasites in a large part of the country, but that they may with reason be looked upon as among the most important causes of diseases of the South in extent, in destruction of life, and in leading to physical and mental degeneration. The fact that the parasites in the United States belong to a new species is a most important one and very suggestive in its bearing on medical zoology.
