The similitude was however not exact; the cyclic hardening curves at room temperature hardened continuously without the plateau seen near the BDTT. Also analogous to the low temperature behavior, the fracture surfaces in this temperature range showed little if any cyclic crack growth. The initiation sites were surrounded by transgranular cleavage, but these regions could not be precisely identified as ones of cyclic growth. These cleavage facets did not show typical fatigue damage and looked similar to cleavage facets found on tensile surfaces. It was interesting to note that both of the previous room temperature studies which have been reported in some depth 28, 32 commented on the sensitivity of the fatigue tests to pre-existing flaws. It appeared as though, based on relative initiation sites, the fatigue tests at 600 to 700 K were more sensitivity to pre-existing flaws than the monotonic tests. There was insufficient data from this study to draw...
